EVARDO, Ezekiel John M.
PBCTP 7-1 | Technology for Teaching and Learning

Individual Worksheet #1
Technology-Enhanced Learning Task

Context

Subject Area
Technology and Livelihood Education (Information and Communications Technology)

Grade Level
Grade 7 (MATATAG Curriculum)

Mode
Blended Learning (In-person laboratory session with online resource access)

Design of the Activity

Learning Objective
By the end of the activity, students will be able to **create a formatted "Personal Student Profile"** using Microsoft Word or LibreOffice Writer, incorporating text styles, page layouts, and inserted images to demonstrate proficiency in basic word processing.

Framework
The framework of this activity is based from **Constructivism**, where it posits that learning is an active process where learners construct new ideas based on their current and past knowledge. In this activity, students aren't just following a "click-here-then-here" tutorial; they are **learning by doing**. They take their personal data (existing knowledge) and organize it into a digital format, solving formatting "puzzles" (how to center a title or wrap text around a photo, etc.) as they go.

Role of Technology
The technology here is used as a **tool of and for learning.** MS Word or LO Writer acts as the cognitive tool that allows the student to represent their thoughts and information in a structured, professional visual format.

Brief Description of Technology Tool(s)
- **Microsoft Word:** A word processing software used for creating, editing, and formatting documents.
- **LibreOffice Writer**: A free and open source software alternative for Microsoft Word.
- **LMS** *(e.g. Google Classroom/PNU LMS)*: Used for distributing the activity rubric and for the final submission of the digital file.

Alignment Justification
The use of MS Word/LO Writer aligns with Constructivism by turning the student into an **active builder of information**. The *"Undo"* function and *Ribbon* interface encourage a **trial-and-error approach** where students discover how the software works through direct experience. By using Multimedia Integration, students can **express their ideas** through both text and visuals (Multiple

Representations). Finally, the use of Templates provides the necessary **scaffolding**, giving Grade 7 learners a professional foundation to build upon as they develop their own design competence.

Reflection

How does understanding how learners learn influence your decision to use technology in teaching?

Understanding how students learn is the foundation of effective teaching because it shifts the focus from what I am doing to what the students are experiencing. **In designing this activity, my choice to use Microsoft Word/LibreOffice Writer is driven by the belief that technology should serve as a construction site for knowledge rather than just a digital version of a textbook.** By recognizing that Grade 7 students are at a stage where they need to bridge the gap between abstract concepts and concrete results, I can move away from treating them like "empty vessels" who simply memorize shortcut keys. Instead, I view them as active participants who need the right tools to build their own digital literacy.

This shift in perspective directly changes how I use technology in the classroom. When I apply a constructivist approach, the software's features—like the "Undo" button or the instant change in font—become more than just technical buttons; they become learning aids. In a digital suite, a student sees the result of a command the moment they click it. This immediate feedback helps them quickly connect what they do with what happens on the screen, making the learning process much more effective than traditional pen-and-paper methods. It allows them to experiment and learn from their mistakes in a way that builds real confidence through discovery.

Ultimately, matching technology with learning theory ensures that my lessons are purposeful and fit the needs of my students. By choosing tools that encourage exploration and trial-and-error, I am creating an environment where students feel capable of creating something of their own. This approach doesn't just teach them how to use a specific program; it teaches them how to be problem-solvers in a digital world. As an educator, my goal is to ensure that every click and formatting choice helps them gain a deeper, lasting understanding of how to organize and share information.

Constructivist Approach to MS Word (Grade 7 TLE)
Posted on the Online Forum Board

For my activity, I designed a "Personal Student Profile" project for Grade 7 TLE that purposefully moves away from traditional assessments where students simply identify icons or define their functions on paper. Instead of a quiz asking what a specific button does, this task requires students to use those tools as "digital building blocks" to create an authentic document from scratch. By applying a Constructivist framework, I've turned the software into a workbench where learners must solve formatting puzzles—like figuring out how to wrap text around an image or organize information using tabs—through actual practice. This approach allows students to discover the logic of word processing through trial and error, using the "Undo" button and real-time visual feedback to guide their own learning. Ultimately, the students aren't just memorizing a toolbar; they are acting as information architects, building their digital literacy through a project that is personally meaningful and aligned with the MATATAG curriculum.

Sample Output

(This is an AI-Generated image intended only for visualization purposes. Because of image generation limitations, there are several erroneous spellings throughout the sample output.)
